Blackwish Banking and Treasury Research

22 October 2026 | U.S. institutional baseline

Status: Educational research and bounded text-only review. Not an institutional establishment plan, compliance certificate, financial recommendation, ratification, deployment or canonical synchronization. Proposed Blackwish exercises are optional and unratified.

Executive finding

A bank is a continuously supervised balance-sheet institution, credit decision-maker, payment participant, recordkeeping system and customer-service organization. Its app is only an interface. Running it requires reliable coordination among those functions. Treasury is the cash, funding and financial-risk function inside an institution; a bank treasury, corporate treasury, government treasury and central bank have different purposes and powers.

The recurring failure is to substitute one state for another: profit for cash, capital for liquidity, a forecast for received funds, internal approval for legal authority, account posting for final settlement, a vendor promise for a tested capability, or a model output for an accountable decision. This dossier makes those separations explicit and proposes fictional tests that do not touch a live institution.

Scope and evidence discipline

The baseline is a conventional U.S. insured commercial bank. Credit unions, trust-only institutions, brokers, payment companies, foreign branches and specialized charters require separate analysis. International principles illuminate risk management but are not automatically domestic law. Source checks were performed on 22 October 2026; the report is not a claim that every rule in every jurisdiction has been reviewed.

Sources are identified near the claims they support. The source registers distinguish full-page inspection, relevant PDF sections, publication landing pages and official indexed excerpts. Historical publication dates do not by themselves mean a source is obsolete; current publication pages, replacements and explicit rescissions matter. No numerical capital, liquidity, reporting or insurance threshold is prescribed here.

Bank institutions and operations

1 Establishing a bank versus operating one

A conventional insured bank requires separate charter and deposit-insurance decisions, with additional Federal Reserve approvals in relevant cases. Organizers must demonstrate a credible business plan, capable management, capital support and risk-management infrastructure. A federal or state charter is not the same thing as FDIC insurance. Ownership or holding-company approvals are not interchangeable with either. Buying an existing bank is not a shortcut around applicable control approvals or inherited deficiencies.

Formation also requires operational readiness: personnel, policies, financial records, systems, vendor arrangements, security, customer operations, reporting and contingencies. A business case should identify target customers, products, income and cost drivers, concentration risks, funding assumptions and a downside path. Approval of one component is not permission for all activities. The Federal Reserve's overview is a map of dependencies, not a personalized filing checklist. [B1]

Running an existing institution adds recurring execution: honoring customer obligations, maintaining liquidity, monitoring credit, reconciling balances, handling exceptions, producing reports and correcting weaknesses. Growth itself creates dependencies: more customers and products can outgrow controls, staffing and data quality. A functioning prototype does not establish institution-wide readiness.

U S supervisory map

OCC supervises national banks and federal savings associations. The Federal Reserve supervises state-member banks and relevant holding companies. FDIC supervises state-nonmember insured banks, alongside state authorities. Insurance, chartering and supervision are distinct roles; responsibilities may overlap. This is a simplified domestic-bank map, not a universal chart for every financial entity. [B2]

2 Governance and operating responsibilities

The board oversees strategy, risk appetite, management and accountability. Executive management runs the institution and implements policy. Business and operations staff execute authorized activity and own the controls embedded in their work. Risk and compliance functions monitor, advise and challenge. Finance maintains reliable accounting and reporting. Treasury manages funding, liquidity and relevant balance-sheet exposures. Internal audit independently evaluates controls and governance. Regulators examine under their public-law remit. [B3]

A functional distinction does not require every small bank to have an identically named department. It does require attention to competence, conflicts and independence. One person should not silently originate, approve, execute, reconcile and independently certify the same consequential action. Where staffing creates unavoidable combinations, the institution needs appropriate compensating review rather than a fictional claim of independence.

Useful records: board and committee minutes; delegated authorities; policies and limits; product inventories; risk assessments; exceptions; customer and loan records; payment messages; reconciliations; incident records; audit findings; remediation evidence. A policy states the intended rule.

A procedure explains execution. A transaction record shows what happened. Independent review tests whether the evidence supports the claim. None is a substitute for the others.

3 Balance sheet language that must remain distinct

Liquidity concerns paying obligations at the required time. **Capital** absorbs losses. **Solvency** concerns whether asset values support liabilities, subject to the relevant valuation and legal framework. **Profitability** measures income against expenses over a period. A profitable institution can run short of cash; cash availability does not prove that losses have not undermined capital. Selling assets for liquidity can crystallize losses. Accounting equity and regulatory capital are related but not identical measures. [B4]

A deposit is ordinarily a liability of the bank. A loan it holds is ordinarily an asset, whose collectability matters. Bank assets also include securities and cash assets; liabilities include deposits and borrowings. [B5]

Illustrative accounting sequence not an instruction to transact

1. A bank approves a loan subject to conditions: approval alone is not disbursement.
2. If it funds by crediting the borrower's deposit account, loan assets and deposit liabilities increase.
3. If the customer pays an account at another bank, interbank settlement introduces a separate liquidity requirement.
4. The institution reconciles customer records, payment messages, settlement balances and general-ledger entries.
5. Subsequent repayments, fees, interest and credit deterioration have distinct accounting effects.

This example is deliberately simplified. Real accounting depends on transaction terms and applicable standards. It rejects both the idea that deposits are the bank's equity and the idea that an internally posted balance eliminates settlement obligations.

4 Customer and deposit operations

The customer lifecycle includes product design and disclosures; applicable identification and due diligence; account ownership and access rights; deposits and withdrawals; interest, fees and statements; payment exceptions, disputes and complaints; restrictions, dormancy, closure and record retention. Different products bring different obligations.

The core banking system maintains records, but its output must agree with settlement accounts, connected systems and the general ledger. Unexplained differences need an owner, age, investigation, escalation and supported resolution. An unsupported balancing entry is not reconciliation. Deposit-reconciliation practices should avoid disadvantaging customers when discrepancies occur. [B6]

Deposit insurance protects qualifying deposits at insured institutions under applicable coverage rules; it is not insurance for every product sold through a bank. Securities and mutual funds do not become insured deposits because a bank offers them. Coverage depends on ownership and aggregation rules, not merely an institution's logo. [B7]

Operational distinction: a customer complaint can reveal a process defect even when the core ledger balances. Accounting accuracy does not by itself establish correct disclosures, authorized access, fair treatment or timely handling of errors.

5 Lending is a lifecycle

A practical lifecycle is: customer need, application, underwriting, credit decision, documentation and closing, funding, administration and monitoring, then repayment, sale, workout, collection or charge-off. Underwriting examines repayment capacity, purpose, terms and risks; collateral does not replace an understanding of repayment. A bank may sell ownership while retaining servicing responsibilities. Individual loans can appear sound while the portfolio becomes dangerously concentrated in a common industry, region or collateral market. The current OCC anchor is the June 2026 Version 1.0 Lending and Loan Portfolio Risk Management booklet, which addresses the lifecycle and portfolio together. [B8]

Illustrative records and gates

- Application: requested purpose, borrower information and applicable disclosures.
- Analysis: evidence supporting repayment assumptions and identified weaknesses.
- Decision: accountable authority, conditions and documented exceptions.
- Closing: complete and consistent documents; unfulfilled conditions remain visible.
- Funding: authorized disbursement, not just an approved status flag.
- Servicing: accurate payment allocation, notices and customer handling.
- Monitoring: emerging deterioration, overdue items and shared exposures.
- Resolution: documented repayment, sale, workout or loss treatment; no silent disappearance of an unresolved obligation.

This is a proposed process map, not a universal legal checklist. Product-specific implementation requires qualified review. A favorable model score should not erase missing evidence or bypass applicable decision controls.

6 Payments clearing settlement and reconciliation

An educational payment chain is instruction, authentication/authorization, validation, clearing, settlement, posting/reconciliation and exception handling. Clearing processes and exchanges information; settlement discharges the relevant obligation through the specified mechanism. Reconciliation checks that the instructions, messages, settlement movements and books agree. Rules for timing, returns, disputes and finality differ among payment systems. [B9]

Fedwire is a real-time gross settlement system with final and irrevocable participant settlement once processed under its governing framework. That property must not be transferred indiscriminately to ACH, cards, checks, customer disputes or every legal claim connected with a payment. [B10]

Useful state vocabulary: prepared, authorized, transmitted, accepted, rejected, pending settlement, settled, reconciled, disputed and corrected. These labels are illustrative; a real implementation must

map its terms to the specific rail and contracts. A user interface saying 'complete' should not obscure an unsettled or unreconciled obligation.

7 Compliance and customer protection

Compliance is an operating capability, not merely a set of written policies. An effective compliance-management system connects board and management oversight, capable staff, monitoring, complaints and corrective action. Applicable obligations can include fair lending, disclosures, electronic transfers, privacy and servicing. Product, charter and jurisdiction determine the exact requirements. [B11]

BSA/AML work includes risk-based controls, responsible personnel, training, independent testing, applicable identification/due diligence, monitoring, recordkeeping and reporting. Sanctions compliance is related but distinct. Fraud detection, AML monitoring, sanctions screening and underwriting answer different questions and should not be treated as one universal risk score. [B12]

Currentness correction customer due diligence

FinCEN's consolidated FAQs incorporate February 13, 2026 exceptive relief concerning repeated beneficial-owner identification/verification when existing legal-entity customers open subsequent accounts. Avoid the obsolete universal claim that full collection must be repeated at every account opening. This relief is not elimination of customer due diligence or other obligations. The operative conditions need checking for any real implementation. [B13]

8 Technology third parties fraud and continuity

Outsourcing a core platform or customer interface does not remove the bank's responsibility to operate safely and comply with applicable law. Relationship management should address criticality, provider capability, contracts, monitoring, concentration and exit options. [B14]

The September 11, 2026 replacement third-party guidance is explicitly proposed; the announcement says existing guidance is to be replaced when finalized. Do not present the proposal as an already finalized rule. Supervisory guidance is not interchangeable with binding regulation. [B15]

Business continuity concerns sustaining critical services, not merely possessing backup files. Map dependencies across people, systems, facilities, communications, vendors and payment access; test recovery and correct weaknesses. A system can restart while its records remain inconsistent. [B16]

Defensive controls include restricted access, segregation, independently verified sensitive changes, logging, incident escalation and recovery validation. Fraud can be internal or external. Audit and management monitoring complement, rather than replace, controls at the point of action. [B17]

Models and AI are not legal authority

The April 17, 2026 interagency model-risk update supersedes listed prior guidance and addresses risk-based model development/use, validation/monitoring, governance and vendor models. It explicitly says the guidance is not enforceable standards and excludes generative and agentic AI from its scope. It therefore is not authorization for autonomous loan approval, fund movement or bank governance; the exclusion also is not an exemption from other applicable duties. [B18]

9 Assurance reporting and distress

Internal audit, external audit where applicable, management monitoring and regulatory examination are separate activities. A favorable result from one does not prove all risks controlled. Findings need owners, remediation and evidence that the fix works. [B19]

Regulatory reporting draws from controlled financial records. The relevant Call Report form depends on institution characteristics. Reports should reconcile to the underlying records and retain supported adjustments. [B20]

Liquidity contingency planning, capital remediation, operational incident recovery and statutory bank resolution are different responses. If a bank fails, the FDIC receiver role is not an ordinary management-controlled shutdown; it follows a legal process addressing assets, liabilities and creditor treatment. Do not imply that uninsured claims, investors or every obligation necessarily receive immediate full repayment. [B21]

Illustrative operating cadence

At opening, responsible teams establish available cash, settlement requirements, overnight exceptions and material incidents. During the day they process authorized customer and credit activity, monitor constraints and escalate exceptions. At close they reconcile ledgers and external movements, investigate differences and preserve carry-forward items. Periodic governance reviews assess concentrations, funding, capital, profitability, complaints, vendor performance and unresolved findings. Frequency and content must fit the actual institution; this is an explanatory rhythm, not a prescribed supervisory timetable.

Treasury functions and operating controls

Four different functions

- **Bank treasury:** fund the balance sheet and manage liquidity, interest-rate exposure, collateral and payment liquidity within approved limits. Not lending approval, independent risk oversight, deposit insurance or an unlimited central-bank backstop.
- **Corporate treasury:** forecast cash and manage bank relationships, funding maturities, working-capital timing and authorized financial hedges. Not accounting profit or permission to spend.
- **Government Treasury:** execute authorized collections, disbursements, cash forecasting, debt issuance and public accounting. Not the legislature, central bank or an unrestricted national wallet.
- **Central bank:** perform statutory monetary, settlement and financial-stability functions. Not a finance ministry, budget appropriator, ordinary commercial lender or survival guarantee.

This taxonomy is our synthesis. Fiscal and monetary authority remain distinct even when institutions cooperate. [T1]

Bank treasury

The question is not simply whether assets exceed liabilities: can the legal entity deliver the required currency at the required location and time, normally and under stress? Treasury needs cash flows by entity/currency/maturity; funding concentrations and maturity calendars; intraday obligations and dependencies; pledged versus available collateral; asset-liability management linking repricing, funding and liquidity exposures; stress scenarios and contingency funding; escalation ownership and operational readiness.

BIS principles address diversified funding, intraday liquidity, collateral location and mobilization, and contingency funding plans. These are international supervisory principles; domestic applicability and enforceability vary. An economically valuable security may still be unavailable for today's settlement if pledged elsewhere or operationally inaccessible. [T2]

Discount-window eligibility, executed arrangements and pledged collateral matter; do not assume limitless unsecured rescue funding. [T3]

Corporate treasury

Profit does not ensure payroll cash. Connect receivables and collection dates; payroll/supplier/tax/debt calendars; opening cash and restrictions; funding availability/maturity/contract terms; currency and interest-rate exposures; forecast-versus-actual investigation. A forecast is an estimate, not received cash. A cash-flow statement records flows, not permission to spend. [T4]

Proposed governance synthesis: distinguish recommendation, approval, confirmation, settlement and reconciliation. A hedge should reference an identified exposure, approved objective and monitoring method; relabeling speculation does not remove its risk. Financial reporting is separate. IFRS 7

concerns financial-instrument and risk disclosures, not an operating licence; not all U.S. entities use IFRS. [T5]

Government Treasury

Keep four records distinct: budget authority (legal authority to incur obligations under specified conditions); obligations (commitments requiring payment under governing terms); outlays (payments liquidating obligations, subject to accounting definitions); cash/debt position (available balances and financing liabilities). Cash does not authorize a program. Spending authority does not establish available cash, systems readiness or payment instructions. GAO's glossary supplies foundational terminology, not a replacement for current appropriations-law review. [T6]

TFX guidance states Treasury forecasts daily cash needs up to 12 months ahead and uses forecasts for borrowing amount/timing; agencies' advance reporting supports TGA management. Forecasting, legal approval and payment execution differ. [T7]

Debt issuance involves announcement, bids, awards and issuance against payment, followed by maturity and interest servicing. Issuing debt is not collecting tax, earning revenue or creating spending authorization. [T8]

The TGA is the government's account at the Federal Reserve in its fiscal-agent role, not each agency's accounting appropriation balance. [T9]

No magic print money command

A customer deposit is a commercial-bank liability. A reserve balance is a bank asset and central-bank liability. Bank lending can create deposits, but credit, capital, liquidity, profitability and regulatory constraints remain. The Bank of England rejects the simplistic model of merely relending existing deposits or mechanically multiplying reserves. This is a UK monetary-system explanation, not U.S. charter law. [T10]

The Federal Reserve distinguishes independent monetary securities decisions from Treasury borrowing and issuance. Do not portray every central-bank purchase as a Treasury instruction to finance expenditure. [T11]

The Fed Board issues Federal Reserve notes; Treasury's Bureau of Engraving and Printing manufactures them through the print-order process. Physical production, distribution, reserve accounting and spending authority differ. [T12]

Approval is not settlement

Proposed operational state model: requested > validated > approved > released > accepted by payment system > settled > reconciled. Not a universal legal sequence. Approved must not be recorded as paid; message sent is not automatically settled.

Fedwire settles through central-bank accounts; finality occurs at its defined rule point. Do not generalize to every payment rail or imply that final settlement eliminates underlying fraud claims or other legal disputes. [T13]

Proposed operating day control design

Stage	Work	Evidence
Opening	Reconcile prior balances, investigate breaks, confirm restrictions and obligations	Reconciliation, owner, opening position
Forecast	Update expected flows and stress assumptions	Versioned forecast, source timestamps
Decision	Choose authorized funding and payment actions	Authority reference, limits check, approvals
Execution	Controlled release; observe acknowledgement and settlement	Transaction IDs, states, timestamps
Intraday	Track deadlines, liquidity, collateral and failures	Position snapshots, escalation
Close	Independent statement-to-ledger reconciliation and forecast update	Closing position, unresolved-break register
Oversight	Review breaches, forecast errors and recurrence	Management report, remediation evidence

This table is synthesis, not a quoted regulatory checklist. Proposed additional checks: independent beneficiary-change verification, protected credentials, duplicate-release prevention, preserved original entries and correction records, aged unresolved items, outage and recovery ownership.

GAO's **2025 Green Book**, published 15 May 2025, is **effective beginning FY2026** and supersedes the 2014 version. Separate authority, custody and accounting where practical; use alternative controls where full segregation is impractical. Segregation cannot eliminate collusion. This federal standard is not a universal private-sector mandate. [T14]; [T15]

International distinctions

Treasury-single-account structures can consolidate cash visibility and management without erasing fund accounting or legal restrictions. The cited IMF June 2010 working paper is analytical guidance, not binding law. [T16]

Euro-area monetary policy operates through the Eurosystem while national fiscal institutions retain distinct functions. National-central-bank portfolios must not interfere with monetary policy or violate monetary-financing restrictions. Do not copy the U.S. Fed-Treasury diagram unchanged. [T17]

Specify currency, legal entity, banking access, accounting framework and jurisdiction before implementation.

Fictional tests and bounded compatibility review

Fictional illustration Harbor Studio contemporary drama

Monday unrestricted bank cash is $120,000; Tuesday payroll is $90,000; a receivable of $80,000 is expected Friday. Payroll can be met, but leaves $30,000 before other obligations. Friday's forecast is not Monday's cash. The treasurer records a delayed-receipt scenario and submits authorized options to the proper approver.

The payment team releases payroll after approval. Its ledger records actual payment state, not merely approved. An independent reconciler compares payment records with bank evidence. The bank separately manages settlement liquidity: the studio deposit and the bank's central-bank balance are not the same account. Neither can instruct government Treasury to manufacture currency to cure a shortfall.

Proposed Blackwish text only tests not adopted canon

Does every expenditure have both authority and available resources? Is each balance assigned to an issuer and legal entity? Is a forecast distinguishable from a completed transfer? Can failed settlement remain visible without falsely undoing approval or falsely claiming payment? Treasury is controlled management of timing, authority and obligations, not merely possession of money.

Review scope and method

This review uses only the selected conversation instructions and the research in this dossier. It is not a reconstruction of the full Blackwish canon, a certification that every prior deliverable was checked, or a new ratification. The three Zen reviews below use an operational gloss: POINT = objective; BRIDGE = evidence and authority; PATH = consequences, alternatives and stopping; SHADOW = assumptions and counterexamples. The final Death Knell challenge is bounded to the claims in this document. These names do not imply reproduction of a complete canonical method.

Zen review 1 institutional identity and authority

POINT. Explain who can do what without treating 'banking' or 'Treasury' as one unlimited financial power.

BRIDGE. The source map separates charter/insurance/supervision; a bank's board and management; corporate treasury; government budget execution; and central-bank monetary and settlement functions. Public sources explain institutional architecture. They do not authorize this project to exercise any of those powers. Internal research approval, a fictional board decision, and statutory authority remain different things.

PATH. Use the taxonomy to label every scenario actor, legal entity, balance and action. When the setting changes jurisdiction, replace the institutional map rather than relabeling U.S. agencies. Stop a real implementation claim when charter, jurisdiction, activities or authority are unknown. Continue unrelated text-only research rather than treating a missing real-world authorization as a blocker to all analysis.

SHADOW. A character called 'Treasurer' may hold different powers in a company, municipality or kingdom. A modern central bank is not a fantasy treasury with unlimited coins. A bank vendor may perform tasks without possessing the bank's public-law status. Similar words do not prove equivalent authority.

Finding. Compatible as a research distinction. No authority has been granted or exercised.

Zen review 2 evidence accounting and process state

POINT. Prevent the document's process language from converting an estimate, approval or visible interface state into an accomplished financial event.

BRIDGE. Source-supported distinctions include liquidity/capital, loans/deposits, payment clearing/settlement/reconciliation and government budget authority/cash. The proposed operating-state models and record lists are original explanatory synthesis, not statutory universal checklists. Current publication versions and explicit proposal labels constrain the conclusions.

PATH. Preserve source timestamps, actual transaction states, unresolved differences and the evidence used to close them. A correction should retain the original record and its reason rather than erase history. Where facts are missing, use 'unknown' or 'pending' instead of 'complete.' An investigation may stop once its stated question is answered with adequate evidence; it must not claim prevention merely because a check was scheduled.

SHADOW. A bank statement may show a posted item while a different process remains disputed. A balanced ledger may contain an unauthorized transaction. A signed approval may never have been executed. A planned funding source may be unavailable because collateral or operational readiness is missing. A source page accessible today may describe a historical or proposed rule.

Finding. The research supports explicit states and evidence limits, not certainty beyond the record.

Zen review 3 resilience consequences and alternatives

POINT. Examine failure interactions without assuming that a technically working system is safe, lawful or institutionally viable.

BRIDGE. The bank research distinguishes credit concentration, customer treatment, liquidity, capital, operational continuity and third-party responsibility. Treasury research adds currency, timing, legal-entity and collateral constraints. These risks interact, but they are not interchangeable. Model-risk guidance that excludes generative/agentic AI does not provide an AI operating license.

PATH. In fictional scenarios compare containment, delayed execution, independent review, funding alternatives and orderly recovery. Preserve each option's costs and uncertainty. Do not test on real customers, move money, submit filings, change a live app or synchronize canon under the cover of a scenario. A real implementation needs its applicable authorization and institution-specific professional review.

SHADOW. Backups can restore corrupted data; independent reviewers can share the same flawed assumption; segregated roles can collude; more profitable lending can increase correlated exposure; emergency funding may not arrive when required. A system surviving one scenario does not establish general safety.

Finding. Suitable for bounded text-only counterexamples. No resilience certification is established.

Final bounded Death Knell challenge

Strongest objection: the breadth and polished presentation could make this dossier look like a complete manual for operating a bank, even though its evidence is deliberately limited and several sources are explanatory or supervisory guidance rather than binding law.

Response: keep the research status at the opening; retain the source-access distinctions; state where sources are historical, foreign, proposed or nonbinding; avoid prescriptive threshold tables; label invented workflows and scenarios; and preserve the institution-specific implementation boundary. Neither three reviews nor this challenge can supply missing legal authority, operational validation or full-canon evidence.

Residual uncertainty: no real institution, charter, jurisdiction-specific activity list, audited systems or comprehensive current-law inventory was provided. Consequently readiness, compliance, viability and permission to execute remain unestablished.

Decision: the dossier may be delivered as reviewed educational research. Proposed Blackwish exercises remain optional and unratified. No original project material is overwritten, no live action is performed, and no canonical synchronization follows from delivery.

Fictional counterexamples beyond fantasy

- **Contemporary business drama:** Harbor Studio's payroll is due before a forecast receivable. Test cash timing separately from profitability and spending approval.
- **Legal thriller:** a perfectly balanced payment ledger conceals an unauthorized release. Test authorization separately from accounting accuracy, while leaving investigation outcomes uncertain.
- **Science-fiction settlement:** an off-world branch owns valuable collateral that cannot be mobilized before the local payment deadline. Test location, currency, communication delay and legal-entity access rather than inventing frictionless wealth transfer.
- **Historical institutional drama:** a treasury has cash in its vault but no lawful appropriation for a proposed expense. Test possession against spending authority using the fictional jurisdiction's stated rules, not anachronistic U.S. law.
- **Disaster recovery procedural:** software returns after an outage, but customer and settlement records disagree. Test integrity, service availability and evidence-based reopening as separate gates.

These are text-only thought experiments. Each has a bounded question; none authorizes financial activity, human experiments or deployment.

Source registers and evidence scope

All sources were checked on 22 October 2026. Select a source title to open the official page. The notes identify what was inspected; an indexed excerpt is narrower evidence than full-document inspection. Older explanatory material remains limited to its stated scope, including IMF 2010 analysis, the Bank of England 2014 explanation, GAO 2005 terminology and Federal Reserve and ECB 2024 explainers. No exhaustive current-law, institutional-compliance or full-canon verification is asserted. The proposed taxonomy, operating table, reviews and fictional scenarios are original synthesis.

The FDIC deposit-insurance application landing page returned HTTP 403 and was not treated as inspected. Source B1 supplies the accessible formation explanation. Treasury substantive source pages were accessed successfully, including the canonical business.gov.au page after an initial www address failed.
