Blackwish CP002 source recovery

Verified file identity and the remaining gaps

19 October 2026

Every entry in the 308-row CP-002 evidence manifest now has an explicit status. The bounded inventory is complete; recovery of every original payload is not.

265 files verified

Their SHA-256 digests and byte sizes match the original manifest exactly. Together they contain 15,986,671 verified bytes. Of these, 31 were already available and 234 were recovered during this inventory pass. The three files found in the earlier discovery are included in the 31, not added again.

43 files not located

These targets were not located in recorded, bounded exact-title Library searches. That does not establish permanent absence, deletion or impossibility of future recovery. No digest mismatches or access-limited retrievals were reported.

308 statuses accounted for

There are no duplicate filenames or missing statuses. Existing and recovered bytes were rehashed rather than accepted on filename alone.

Files are not relationships

The 265 FILES count coincidentally matches the separate historical count of 265 RELATIONSHIPS. This inventory does not recover or establish that original relationship mapping, its checkpoint correspondence or its scientific validity.

What the verification means / page 2

Exact remaining filenames / pages 3–5

What was verified

The preserved original manifest supplied the expected filenames, sizes and hashes. Existing files were reused without downloading them again. Remaining searches were partitioned by filename; earlier bounded non-discoveries were preserved. Recovered files were kept separately from historical originals.

The aggregate verification rehashed all 265 available payloads after collection. Preparation of this PDF also rechecked those payload identities and sizes, the 308 unique statuses, the 43-name gap list and the optional 308-row inventory CSV.

Identity is not truth

A matching hash establishes byte identity with the manifest, not factual correctness, scientific replication, hardware behavior or safety. No historical engine was imported or executed. This was not a semantic reading of every recovered file, a rerun of historical tests, a new experiment or validation of every reported result.

Recovery creates no new ratification, deployment permission or canonical synchronization. Historical pre-checkpoint NOT_RATIFIED labels remain historical; finding those labels does not revoke later CP-002 authority. Failed or superseded attempts remain distinct from later versions.

Exact record fingerprints

Original CP-002 evidence manifest SHA-256

These fingerprints identify the records used for this report. The optional full inventory lists all 308 entries; it is not required reading. The following pages list every still-unlocated target, without private locations or download links.

Unlocated files 1 to 15

Individual reports, tests and traces for versions 1.6–2.5. The four already-verified combined artifacts are useful evidence, but are not substitutes for these exact individual payloads.

blackwish_causal_registry_v5_8_engine.py

Status for every name on this page: not located in the recorded bounded exact-title searches. No permanent-absence claim is made.

The recovery question remains open for these specific bytes. Any future candidate must match its own manifest digest and size; a similarly named or later successful version does not close the gap.
