Blackwish mapping review

20 October 2026 | Bounded design proposal

Three additive changes make the mapping more precise without making it automatic: grammar and intended meaning stay distinct, material movement keeps its accounting and unknowns, and an object's usefulness depends on its current relations and purpose.

The patches exist as tested reference records, schemas and offline validation checks. They are not installed generator behavior, a general-language input engine, a physical simulator, or ratified doctrine. The examples are authored hypotheticals, not experiments or observations.

The three review choices

- **GM - Grammar and meaning.** Keep exact wording, contextual word classes, alternative readings and user-selected creative meaning. Do not turn language into an automatic catalogue assignment or event.

- **IR - Material transfer.** Track selected material portions through wiping, filtering and maintenance. Local success cannot erase residuals, other endpoints or history.

- **CF - Contextual functions.** Track detached parts, usable growth room, ordinary objects with critical or ceremonial roles, passengers, and damaged or incomplete information.

Evidence limits and manual review 10

Separate decision. GM, IR and CF are new review labels for this brief. They are not the L/H/C/N choices in the already delivered reader. The ratification of those earlier measures does not approve the GM/IR/CF specifications presented here. Approval here can be limited to bounded non-live design development; it does not publish, deploy or canonize anything.

Shared distinctions and unknowns

Read this once for all three changes

Source is not interpretation

The exact source text or representation is one record; a proposed reading is another. A grammatical analysis can be internally valid while its sense, referent or context remains unresolved. The user's creative reading can be intentionally useful without becoming a dictionary definition, etymology or measured causal mechanism.

Interpretation is not a world event

Mentioning a wet coat does not establish a current coat, rain, absorption or a transfer path. A wish to sit does not establish sitting, a chair, ability or permission. The IR and CF outcomes are stipulated within their particular hypothetical cases, not inferred physical laws.

World state is not observer knowledge

A case author can stipulate an intact source or retained material while a character sees only a smudge, a fragment or a clean-looking surface. Observations retain their access and scope. A known immediate donor does not establish ultimate origin, and a possible pathway does not show that it occurred.

Description is not authority

A quoted command is not a request from the user. Meaning attributed to a place creates no ownership, access right or governing authority. Passenger consent does not supply missing physical suitability. Review results and previous module approvals do not ratify these new packages.

Unknown does not mean absent or false

Leave quantity, reference, timing, alternatives, safety and interpretation unresolved where the example supplies no basis. Unknown amount is not zero; unknown location is not destruction. A named actor, reason, event completion, safe load or missing word must not appear merely because a schema has somewhere to store it.

Identity is scoped

A detached part can remain the same instance while its relations and functions change. Material portion IDs can change when an aggregate is partitioned, without a stipulated change of material kind. CF entity IDs are local: the place CF03/P1 and the person CF04/P1 are not the same entity. Resolve fixture ID plus local ID; no cross-fixture identity is asserted.

Preservation scope. Verified selected bytes and retained new predecessors do not repair already disclosed historical draft losses or prove the whole project history pristine. Current checks and earlier losses remain separate facts.

GM word classes and intended meaning

Keep the language before mapping it

Four separate layers

- **Surface.** Preserve the exact wording, spelling, punctuation, whitespace and source spans.
- **Grammar.** Record contextual part of speech, morphology, construction and syntactic relation under a declared language and annotation scheme.
- **Interpretation.** Keep candidate senses, participants, properties, events or states, scope and attribution.
- **Mapping.** A proposed link to a Blackwish reference needs its own justification and version binding. It is not implied by a matching word.

Word classes are contextual

The common exchange inventory covers nouns and proper names; verbs and auxiliaries; adjectives and adverbs; pronouns and determiners; adpositions; coordinating and subordinating conjunctions; particles; interjections; numerals; punctuation; symbols; and classified-as-other uses. Language-specific detail can supplement it. Null means unassigned, not the same thing as classified-as-other.

A noun can denote an activity, relationship or idea. A verb can denote a state rather than deliberate action. A pronoun can refer to someone without naming them. A grammatical object is not an inventory object, and a grammatical subject is not necessarily an actor.

Example. In "The gate was painted by Mira," the gate is the grammatical subject and affected surface; Mira is the actor in that reading. "hunting" alone remains underdetermined, while surrounding constructions can support verbal or nominal analyses.

Preserve both intended readings

"I want to sit down" has an ordinary desire-to-sit reading. Separately, the user selected a creative interpretation involving evoking comfort and control, and gaining capacity to refine a twining narrative without degradation through repetition or identical processing. Both remain available; ordinary grammar must not disqualify the creative branch.

That selected meaning is not a claim that the words historically derived from it or that it is already an implemented causal mechanism. Selecting a meaning and ratifying the proposed schema are different decisions. Unknown or custom words must not be suppressed merely because familiar associations are more frequent.

Implementation boundary. No general-language input engine or automatic catalogue binding has been installed. All GM mapping links are empty, and the selected validator deliberately rejects nonempty links until a binding adapter is implemented. The existing grouped interactable rundown remains an overlapping editorial guide, not a stable-ID taxonomy.

GM scope and source preservation

A correct tag does not settle a complete meaning

Keep coherent alternatives

"paint" can be a noun or verb; "a painted gate" retains adjectival and reduced verbal-modifier alternatives. "down" varies across sitting, shutting a gate down, moving down a slope, coat filling, mood and drinking. Do not assign one global class or sense to a spelling, or mix parts of different analyses without a new justified candidate.

"Mira saw the painter with a telescope" retains the telescope-as-instrument reading and the telescope-associated-with-painter reading. Missing context does not license a forced selection. All supplied syntactic analyses are partial, not automatically produced parses.

Scope and attribution change what is claimed

"Not every coat is wet" differs from "every coat is not wet." "I do not want to sit down" is not automatically "I want not to sit down." "She may not leave" can express possible nondeparture or withheld permission. Neither reading decides what happens.

"She was painting the gate" does not establish completion. "If Mira painted the gate, it would be blue" does not establish an actual past event. The example *Mira said, “I painted it.”* stays attributed to Mira rather than becoming verified painting or the current user's assertion. Questions, wishes, commands and hypotheses do not become tool instructions.

Morphology and phrases do not rewrite the source

The painter/painters illustration separates a proposed synchronic derivational relation from plural inflection; it supplies no historical origin. In "picked it up," the expression's separated members must not absorb the intervening "it." Spanish "al" can anchor two labelled analysis forms without replacing the source with "a el." The French example is a minimal preservation/tag illustration, not validated French coverage.

Exact means exact

Offsets are zero-based Unicode code points with exclusive ends, not UTF-8 bytes, UTF-16 positions or displayed-character counts. The source hash covers the exact UTF-8 encoding of the preserved string, not unknown original upload bytes. Whitespace, line breaks, tabs, punctuation, emoji and decomposed accents remain unchanged; normalized forms belong in a separate layer.

A JavaScript consumer would need explicit code-point-to-UTF-16 conversion before slicing. Hashes and span checks can detect representation changes, but cannot prove that a proposed interpretation is correct. Multilingual segmentation, sarcasm, metaphor, ellipsis and pragmatic intent remain open boundaries, not completed capabilities.

IR three material cases

Selected material pools rather than a universal matter model

IR1 A clean looking surface can leave material elsewhere

Stipulated case. A selected pool of inert dirt begins on plate A. A wipe leaves one portion on A and transfers another to cloth C. A later, separately stipulated transfer leaves portions on A, C and plate B. An observation reports no visible mark on A, not zero material.

Repair. Separate appearance, retained material, immediate donor and ultimate origin. Contact alone does not force transfer. Amounts, transfer fractions, duration, ultimate origin, other surfaces and all material outside the selected pool remain unknown.

IR2 One filter endpoint does not settle the others

Stipulated case. A selected particle pool and a distinct selected gas constituent begin upstream. An actual through-media airflow path is stipulated. Some particles are retained and others pass through that path downstream. A local outlet-flow cue occurs; gas fate remains unknown.

Repair. Each claim names its material set, location and time. Capturing some particles does not establish all-particle removal or gas removal. Flow is not treatment success. A possible bypass is not an observed bypass; no bypass occurrence is established here. Efficiency, quantitative flow, later release, other substances and safety remain unknown.

IR3 Maintenance need not reset the object

Stipulated case. A strainer begins with selected blocking debris, separate surface film and prior deformation. An invented intervention transfers some debris to a bowl and leaves some on the strainer. Selected open area is larger; film, deformation and prior history remain.

Repair. Track changed, unchanged and unresolved properties separately. Larger open area does not establish full flow capacity, restored service life, hidden condition or safety. This is not a servicing procedure and does not decide every use a detached part could retain.

Bookkeeping does not destroy matter

When an aggregate portion is divided into disjoint children, retire the parent from current inventory to avoid counting it alongside its children. The retired ID is historical bookkeeping, not destroyed material. A claim about the parent refers to its active descendants at that time, not every substance in the environment.

"No material identity change" means no stipulated transformation of material kind or composition. It does not require portion IDs to stay unchanged. No numerical mass balance or general transfer dynamics are calculated. These cases make existing distinctions concrete; they do not claim discovery of new physical laws.

CF parts and contextual usefulness

Function and significance are relations rather than intrinsic rankings

CF01 Detached parts can retain partial functions

Door D1, lock L1 and wall tile T1 retain identity after detachment. The lock's local bolt operation is stipulated, but it cannot secure opening O1 without the operative connection. The detached door cannot vary that opening's aperture. The tile retains visible decoration, not an inferred structural rating.

The door burdens a narrow-passage clearing task, yet a later display use remains possible if a suitable arrangement is supplied. "Semi-functional" must name which function survives. "Dead weight" is object burden relative to a purpose, place and time, not intrinsic worth and never a category for people. Reattachment does not erase wear or certify every function.

CF02 Larger can help when growth room is usable

A larger basket may help an expanding compatible collection when access, fit, handling, support, future configuration and demand are compatible. A larger basket that cannot fit through the required route is not rescued by unused volume. An unspecified future arrangement stays unresolved.

The correction preserves the value of larger possibilities without declaring bigger always better. Extra volume is not a strength rating, safe-load certificate or obligation to grow. The comparison is specific to a purpose and configuration, not a universal utility ranking.

CF03 Ordinary objects can be critical or ceremonial

An ordinary cup is critical to a stipulated token-collection stage because no other usable receiver is available in that initial time window. This absence is explicitly authored, not inferred from an unmentioned alternative set. When a suitable bowl becomes available, the cup is no longer the unique dependency.

Separately, the fictional gathering participants associate the cup with an earlier reunion and the place with a remembered reconciliation. The cup does not need a special type designation to serve ceremonially. Becoming replaceable in the counting process does not erase its attributed meaning or importance.

A special place has attributed meaning and association for particular people in context. That does not compel every observer to agree, grant ownership or access rights, prove physical fitness, or establish supernatural powers. An additional fictional world rule would have to be separately declared; none is supplied here.

What changed. These are explicit context-bound fixtures of existing release, coupling, partial-restoration and association distinctions. They introduce no new object types, universal ranking or global identity engine.

CF passengers and information

Separate safety questions from permissions and readable marks from faithful meaning

CF04 Safe loads and passengers need distinct records

A fictional car has person P1 and parcel K1, separately typed. Keep shared physical constraints, cargo-specific constraints, passenger-specific needs and agency constraints distinct. Passenger bindings are person roles, not inventory objects.

The example retains combined allocation, configuration, support, condition and route; parcel fit, retention and distribution; passenger accommodation, accessibility, protection, emergency needs and ability to leave; and consent plus operator capability and authorization. Every safety conclusion remains unresolved. This is not a complete engineering checklist, and it supplies no numerical rating.

Available seats, cargo capacity or movement do not certify passenger transport. Permission does not fill missing physical suitability. Shared physical constraints do not erase personhood or consent.

CF05 Smudging can produce different outcomes

The source says A8 and remains intact. One altered destination is decoded as A?, leaving the second character unresolved. A margin-smudge branch leaves A8 readable. Another stipulated branch is confidently decoded as AB: legible, but wrong relative to the authored source. An intact transfer also remains possible.

Track source content, its representation, channel, destination marks, received fragments, legibility, completeness, decoding and interpretation separately. The recipient sees the destination, not automatic author knowledge of the source. Readable marks need not be faithful or understood; damage to a copy need not damage the source. Damage is possible, not inevitable.

CF06 A readable fragment can reverse apparent meaning

A fictional source says DO NOT OPEN GATE, but the delivered fragment is OPEN GATE. Treating that fragment as the whole reverses the apparent instruction in this case. It is an illustration, not an instruction to open anything.

The fragment can still satisfy a narrower task, such as identifying whether the received words contain GATE. A reader who knows it is partial can suspend a whole-message conclusion. Correctly decoding received words does not recover omitted content.

Unfinished input stays unfinished. The user's sentence ends at "through partial transfer of". Its continuation is neither supplied nor guessed. These information cases are independent hypotheticals, not reconstructions of missing words. Material-transfer mechanics and grammar analysis remain separate from this representation of information loss.

Grammar counterexample index

Semantic failure types represented by the manual fixtures

Use these as review challenges, not a claim of exhaustive language coverage. E labels locate the underlying manual examples. The index groups related examples instead of listing every validation mutation.

E01. Desire becomes completed action. Wanting to sit supplies no sitting event, chair, ability, permission or reason. The separately selected creative reading must neither be erased nor promoted to etymological fact.

E02 to E05. A suffix chooses ontology or outcome. Hunting can be unresolved, progressive verbal activity, a nominal activity or a clause used as subject. None establishes capture, killing or a named hunter.

E06 to E09. A descriptor supplies hidden causes, or a spelling has one fixed class. Wet coat supplies no rain or absorption; paint can be nominal, verbal or unresolved.

E10 to E14. One spelling forces one sense. Down in a phrasal construction, slope relation, coat filling, mood and drinking cannot share one compulsory interpretation.

E15 to E17. Grammatical role becomes world role. Passive subject is not automatically actor; painted retains alternatives; an event-denoting noun is not a movable thing.

E18 to E20. Modality, quantification or aspect is flattened. Possible nondeparture differs from withheld permission; not every differs from every not; progressive painting does not imply completion.

E21. Grammar or explanation supplies unobserved facts. An interjection is not an emotional diagnosis; weather it is not a causal object; because gives an attributed explanation, not independent causal verification.

E22 and E23. Morphology invents history or phrase spans consume other words. Painter/painters separates derivation and inflection; picked ... up does not include it as part of the expression.

E24 and E25. Negation moves unnoticed. Not wanting to sit is not automatically wanting not to sit, refusal or standing permission.

E26 and E27. An omitted actor is invented. Mira opened the gate supplies Mira in its reading; the gate opened does not identify an actor merely to complete a familiar template.

E28 to E30. Normalization becomes preservation, or English becomes universal. Keep exact Unicode/whitespace; French coverage is minimal; Spanish al stays intact while analysis forms remain separate.

E31 and E32. Conditional or reported content becomes verified occurrence. Past-shaped conditional wording does not prove an actual past event; Mira's report retains its speaker and evidence status.

E33. One plausible attachment suppresses another. The telescope may be the seeing instrument or associated with the painter; missing context cannot force either.

Across the set. Unselected means unresolved, not secretly selected. Coherent alternatives are not interchangeable fragments. Syntactic validity, fluent paraphrase, lexical similarity and a schema pass do not confer truth, world identity or authority.

Material and context counterexample index

Concrete challenges to overgeneralized success and function

IR material cases

IR CX01 to CX02. Looks clean means no residue; removal means destruction. The wiping case retains material on A and transfers selected portions to C and later B.

IR CX03 to CX05. Parent plus children are all current inventory; unknown equals zero; donor equals origin. Retired aggregate IDs prevent double-counting, amounts remain unknown, and cloth C does not reveal the dirt's ultimate origin.

IR CX06 to CX08. Some particle capture proves all-material success; flow proves treatment; a plausible bypass occurred. Captured particles, through-media passage, gas fate and a local flow cue have separate endpoints.

IR CX09 to CX10. Maintenance resets history; contact forces transfer. Film and deformation remain after debris removal; the later cloth transfer requires its own stipulation.

IR CX11. Valid data means physical truth or full coverage. All three cases are finite, fictional and uncalibrated; their checks validate representation constraints.

CF contextual cases

CF01. Detached means useless, new identity or fully repaired on return. Local bolt function can survive without securing an opening. Decoration can survive without structural fitness. Reattachment retains history.

CF02. More volume guarantees better growth options or safe loads. Compare compatible expansion, an access mismatch and an unresolved future arrangement; none supplies a strength rating.

CF03. Critical is intrinsic, alternatives are absent by silence, or replaceable means meaningless. Initial alternative absence is stipulated; a later bowl removes unique dependency, not the cup's separate association.

CF03. Ordinary objects cannot be ceremonial, or meaning creates universal authority. Meaning is attributed in context and establishes neither agreement, physical powers, ownership nor access rights.

CF04. Passengers are cargo, seats prove safety, or consent proves suitability. Person, parcel, shared physical conditions, specific needs and agency stay separate; safe transport remains unresolved.

CF05. All smudges are illegible, or legible means faithful and understood. A8 can remain readable, become A?, or be confidently misread as AB in separate stipulated branches. Copy damage does not destroy the source.

CF06. Readable means complete, or partial means useless. OPEN GATE omits the source's DO NOT, but can still satisfy the narrower word-identification task. Awareness of partiality permits suspension.

CF identity. Matching local labels merge entities. CF03/P1 is a place; CF04/P1 is a person. Fixture ID plus local ID keeps them separate.

The index covers represented semantic failure types, not every possible object, sentence, transfer, context or code mutation. Possible errors are not empirical frequency claims.

Evidence limits and manual review

A bounded design decision rather than deployment authority

What the checks establish

GM. Schema/examples v3, validator v4 and reader v6 are selected. Normal replay covers 34 records, 41 analyses, 16 positive checks and 29 negative controls. These test finite representation constraints, not parser accuracy or complete linguistic correctness.

IR. Selected v2 data/schema checks include 292 assertions and 42 invalid variants. Independent review reports 32 rejected adverse probes and 61 identity/pointer checks. Overlapping author/reviewer negatives must not be added as combined coverage.

CF. Content/schema v4 and validator v5 cover six fixtures. Finite nested checks supplement the schema, which intentionally does not fully type every nested detail. Independent review found no blocker within this bounded reference scope, not empirical validity or ratification.

Selected GM, IR and CF entry points refuse optimized Python. IR's archival validator is unsafe to invoke directly in that mode; use its guarded replay entry. CF refuses overwrite, but multi-file builds are not atomic and rebuilding needs retained predecessor inputs. These are offline safeguards, not production hardening or standalone applications.

Three design lenses remain separate from review

Each package retains three authored perspectives: evidence and identity; consequences and continuity; and agency, meaning and authority. Each uses POINT, BRIDGE, PATH and SHADOW. These are design challenges, not three independent reviewers, empirical tests or ratification.

The decision available now

Final bounded review and selection passed for all three packages under these limits. Approve GM, IR and CF separately for bounded non-live design development, return them for revision, or leave them undecided. Approval here does not install a parser or binding adapter, replace the generator, change live systems, publish work or synchronize canon. Deployment still requires explicit manual ratification.

Complete technical records, fixtures, validators and review evidence are preserved separately, not attached by this brief. Compatibility checks cover inspected passages only, not the whole project or every inherited citation.

Short primary source notes

UD word classes: bounded common annotation vocabulary.

FrameNet original paper: semantic participants versus syntactic realization.

NIST wipe study abstract: sampled surface, receiving wipe and collected material.

EPA air-cleaner guide: material-specific endpoints. Recorded search access succeeded; later direct opens timed out.

Links are copied from input records, with no new external exposition. None of these sources supports the invented event quantities or outcomes. CF adds no new external factual claim.
